

Disclaimer

OpenBedside is engineering software for testing, learning and development.

- **It is not a medical device** and has not been cleared, approved or validated by the FDA or any other regulator.
- **It is not for clinical use.** Do not connect it to devices in use on patients.
- **It is not clinical decision support.** It does not check doses, rates, drug libraries or orders for clinical appropriateness, and nothing it displays is dosing guidance.
- **Auto-programming works against the built-in simulator only.** Software that controls or alters a connected medical device is a regulated device function (FDA, *Medical Device Data Systems, Medical Image Storage Devices, and Medical Image Communications Devices*, final guidance, 28 September 2022). This release refuses to route programming requests to any adapter other than the simulator.
- **Patient association is decided only from sources the hospital allows** for each device: an identifier the device itself reports, a person's association on the Patients page, or the ADT census for the device's registered bed. When they disagree, no patient is sent. Association by location trusts that the device is where it is registered; the gateway cannot see where a device really is. Getting the right patient remains the hospital's workflow and the hospital's responsibility.
- **Use synthetic patient data only.** Once patient identifiers flow through it, the gateway stores and transmits protected health information, and the HIPAA Security Rule's safeguards apply to whoever operates it. This release has no encryption on its HL7 links or web page and no encryption of its database. Real patient data needs all three, plus access logging, first.
- The MDC codes in `codes.py` are labelled with their source and status. None is marked verified against the current Rosetta Terminology Mapping yet. Verify before relying on any of them.

Anyone who takes this code into a regulated product takes on the regulatory obligations for that product.
